

# Vision SDK TDA3xx

(v03.01.00)

## User Guide

**Copyright © 2014 Texas Instruments Incorporated. All rights reserved.**

Information in this document is subject to change without notice. Texas Instruments may have pending patent applications, trademarks, copyrights, or other intellectual property rights covering matter in this document. The furnishing of this documents is given for usage with Texas Instruments products only and does not give you any license to the intellectual property that might be contained within this document. Texas Instruments makes no implied or expressed warranties in this document and is not responsible for the products based from this document.

## IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Customers are responsible for their applications using TI components.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards ought to be provided by the customer so as to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, license, warranty or endorsement thereof.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations and notices. Representation or reproduction of this information with alteration voids all warranties provided for an associated TI product or service, is an unfair and deceptive business practice, and TI is neither responsible nor liable for any such use.

Resale of TI's products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service, is an unfair and deceptive business practice, and TI is not responsible nor liable for any such use.

# 1 Introduction

Vision Software Development Kit (Vision SDK) is a multi-processor software development package for TI's family of ADAS SoCs. The software framework allows users to create different ADAS application data flows involving video capture, video pre-processing, video analytics algorithms, and video display. The framework has sample ADAS data flows which exercises different CPUs and HW accelerators in the ADAS SoC and demonstrates how to effectively use different sub-systems within the SoC. Frame work is generic enough to plug in application specific algorithms in the system.

Vision SDK is currently targeted for the TDA2xx and TDA3xx family of SoCs

This document explains the HW/SW setup for TDA3x EVM. Refer to VisionSDK\_UserGuide\_TDA2xx.pdf for TDA2x EVM related HW/SW setup info.

## 1.1 References

Refer the below additional documents for more information about Vision SDK

Document	Description
VisionSDK_ReleaseNotes.pdf	Release specific information
VisionSDK_UserGuide_TDA3xx.pdf	This document. Contains install, build, execution information
VisionSDK_ApiGuide.CHM	User API interface details
VisionSDK_SW_Architecture.pdf	Overview of software architecture
VisionSDK_DevelopmentGuide.pdf	Details how to create data flow (s) & add new functionality
VisionSDK_DataSheet.pdf	Summary of features supported, not supported in a release. Performance and benchmark information.
VisionSDK_FAQs.pdf	Document contains FAQ

## 2 System Requirements

This chapter provides a brief description on the system requirements (hardware and software) and instructions for installing Vision SDK.

### 2.1 Windows Installation

#### 2.1.1 PC Requirements

Installation of this release needs a windows machine with about 8GB of free disk space. Building of the SDK is supported on windows environment.

#### 2.1.2 Software Requirements

All software packages required to build and run the Vision SDK are included as part of the SDK release package except for the ones mentioned below

##### 2.1.2.1 A15 Compiler, Linker

The windows installer for the linaro tools should be downloaded from below link

<https://launchpad.net/gcc-arm-embedded/+milestone/4.9-2015-q3-update>

The tools need to be installed in "<install dir>/ti\_components/cg\_tools/windows/gcc-arm-none-eabi-4\_9-2015q3" location.

**IMPORTANT NOTE: A15 Compiler and linker MUST be installed before proceeding else compile will fail. Also make sure the compiler is installed at the exact path mentioned above**

#### 2.1.3 Code Composer Studio

CCS is needed to load, run and debug the software. CCS can be downloaded from the below link. CCS version 6.0.1.00040 or higher should be installed.

[http://processors.wiki.ti.com/index.php/Download\\_CCS](http://processors.wiki.ti.com/index.php/Download_CCS)

## 2.2 Linux Installation

### 2.2.1 PC Requirements

Installation of this release needs a Linux Ubuntu 14.04 machine.

**IMPORTANT NOTE:** If you are installing Ubuntu on a virtual machine, ensure it's a 64 bit Ubuntu.

### 2.2.2 Software Requirements

All software packages required to build and run the Vision SDK are included as part of the SDK release package except for the ones mentioned below

#### 2.2.2.1 A15 Compiler, Linker

The Linux installer for the linaro tools should be downloaded from below link

[https://releases.linaro.org/components/toolchain/binaries/5.3-2016.02/arm-linux-gnueabi/gcc-linaro-5.3-2016.02-x86\\_64\\_arm-linux-gnueabi.tar.xz](https://releases.linaro.org/components/toolchain/binaries/5.3-2016.02/arm-linux-gnueabi/gcc-linaro-5.3-2016.02-x86_64_arm-linux-gnueabi.tar.xz)

The tools need to be installed in \$INSTALL\_DIR/ti\_components/os\_tools/linux/linaro location.

**IMPORTANT NOTE:** A15 Compiler and linker MUST be installed before initiating the build else compilation will fail. Also make sure the compiler is installed at the exact path mentioned above after installation of vision sdk.

Use following steps to install the toolchain

```
$> cd $INSTALL_DIR/ti_components/os_tools/linux/linaro
```

```
$> tar -xvf gcc-linaro-5.3-2016.02-x86_64_arm-linux-gnueabi.tar.xz
```

**IMPORTANT NOTE:** Ensure the toolchain is for 32 / 64 bit machine as per configuration of installation machine

If your machine is 64 bit and you have downloaded toolchain from link above

Execute following step on installation machine

```
$>sudo apt-get install ia32-libs lib32stdc++6 lib32z1-dev lib32z1 lib32ncurses5  
lib32bz2-1.0
```

### 2.2.3 Other software packages for build depending upon OS baseline

Ensure these packages/tools are installed on the installation machine

**uname, sed, mkimage, dos2unix, dtrx, mono-complete, git, lib32z1  
lib32ncurses5 lib32bz2-1.0 libc6:i386 libc6-i386 libstdc++6:i386  
libncurses5:i386 libz1:i386 libc6-dev-i386 device-tree-compiler mono-  
complete**

To install

```
$>sudo apt-get install <package_name>
```

## 2.3 Hardware Requirements

Hardware setup for different use-cases is described in this section

### 2.3.1 Single Channel (SC) Use-case Hardware Setup

SC use-case needs the below hardware

1. TDA3xx EVM , power supply (12V 5 AMP)
2. Video Sensors, you would require one of the sensors listed in [section 2.5](#). Please refer [section 2.3.4](#), it visually shows as to where the sensor should be connected.
3. 1Gbps Ethernet Cable (optional)
4. HDMI 1080p60 capable Display Monitor OR LCD Screen. LCD should be connected to LCD out connector, as shown in [section 2.3.4](#). 10" or 7" LCD is supported

**WARNING:** LI Camera Interface is different from LI Camera CSI2 Interface. Putting a CSI2 sensor on LI Camera Interface will damage the sensor

### 2.3.2 VIP multi-channel LVDS capture (SRV) Use-case Hardware Setup

Refer the TDA2x user guide "VisionSDK\_UserGuide\_TDA2xx.pdf" for the LVDS set-up.

To support multichannel LVDS capture on TDA3xx EVM, there are some board modifications required. Please refer to the "Running VPS Application on TDA3XX EVM" section of the VPS user guide to get the more details

1. For VIP capture from Multi-deserializer board, the multi-deserializer board should be configured for 4-channel operation. The CN2, CN3 and CN4 jumper settings should be set.
2. In case of Multi-deserializer capture through VIP or ISS capture from sensors, board modification is required in the base board to avoid I2C issues

**WARNING: Select the display resolution as HDMI XGA TDM mode <TDA3xx ONLY>.** Failing which, only 2 channels of captured video streams are displayed. This is required as some of the VIP input pins is multiplexed with display output pins.

### 2.3.3 ISS Multiple Channel (SRV) Use-case Hardware Setup

SRV use-case needs the below hardware

1. TDA3xx EVM, power supply (12V 5 AMP)
2. UB960 Application Board, power supply (12V 5 AMP)
3. 4 TIDA00262 modules (AR0140 sensor) or IMI modules (OV10640 Rev E sensor) & LVDS cables to connect camera modules to UB960 application board
  - a. List details of this camera module <http://www.ti.com/tool/TIDA-00262?keyMatch=TIDA-00262&tisearch=Search-EN-Everything#tiDevice>
  - b. Details of IMI camera module: <http://www.global-imi.com/media/2015/10/Generic-Minicube-Catalogue-1020151.pdf>
4. HDMI 1080p60 capable Display Monitor

**WARNING: CSI2 Clock:** The maximum CSI2 clock could be 750 MHz, please refer the device data manuals for details. Some of the VisionSDK usecases (UB964 based), overclocks by 50 MHz (i.e. 800 MHz) and it works as expected. This over clocking is due the crystal (25 MHz) used in UB964 EVM, by choosing 24 MHz crystal UB964 CSI2 clock can be operated with-in specified limits.

## 2.3.4 Sensor Interfaces

Figure 2.3 1 15x15 TDA3x EVM (FRONT SIDE)

Figure 2.3 2 15x15 TDA3x EVM (BACK SIDE)

Figure 2.3 3 TDA3x EVM with UB960 Application Board

**NOTE:** For Switch settings refer [section 2.4.2](#)

### 2.3.5 EDID Programming for HDMI Capture

EDID information needs to be programmed on the EEPROM present on the EVM. This is required for the HDMI source to recognize the format and resolution supported by

the receiver (TDA3xx SoC). If this step is not done or if this step fails, then TDA3xx SoC will not be able to receive data via HDMI.

**It's recommended to program the HDMI receivers EDID. The default EDID is programmed to receive 1080P60 video streams only. If stream of different resolution is required (or EDID is corrupted), the EDID would require an update. The following steps details the procedure to re-program the EDID.**

- a) Change pins 1 and 2 of SW8000 dip switch (refer Figure 2.3.4) to ON.
- b) Connect USB cable from board to PC and setup UART for logs (Ref [Uart settings](#))
- c) Connect CCS to IPU1-0 core and load below binary (Refer [Load using CCS](#) till step 8).
  - a. Binary `vision_sdk\apps\tools\Edid_programming_tool\edid_programmer_tda3x_1080p_60.xem4` placed under
- d) Run the core and wait till "EDID programming success full" message comes on UART.
- e) Terminate the JTAG session and restart the board.
- f) Before Running Vision Sdk binaries, change pins 1 and 2 of SW8000 to OFF (towards numbers 1 and 2).

**NOTE:** Refer Load and Run using CCS for details of running the binaries

HDMI CONFIG	1	2	3	4
<b>HDMI capture without EDID</b>	ON	OFF	ON	OFF
<b>To do EDID programming</b>	ON	ON	OFF	OFF
<b>HDMI capture with EDID programming</b>	OFF	OFF	ON	OFF

Figure 2.3 4 HDMI Config via SW8000 dip switch

## 2.4 Required H/W modification / Configurations

### 2.4.1 TDA3XX EVM Modifications for SCH use case

I2C transactions for few sensors like OV10640 fail at 400 KHz I2C frequency. To fix this issue, few resistors need to be updated/changed on the TDA3xx EVM. Please refer to the "Running VPS Application on TDA3XX EVM" section of the VPS user guide to get the more details

### 2.4.2 Changes required on UB960 Application board

1. Configure to supply 9V on the LVDS lines to TIDA00262 modules

- a. J14 Short pins 1-2 as show in **Error! Reference source not found.**

2. Configure UB960 to operate in LVDS in 75 MHz mode

- a. Dip Switch MODE 3 should be ON

3. Refer the picture below

Mode		
<input type="checkbox"/>	<input type="checkbox"/>	4
<input type="checkbox"/>	<input type="checkbox"/>	3

Mode

## 2.5 Supported Sensors

The Table below lists the sensors supported on TDA3xx platform. Please refer [section 2.3.4](#), this details the interfaces that a sensor could be connected to.

Sensor	Details	Comments
OV10635	Sensors OV10635 Sensor (for VIP based use-cases only), should be connected to Omni Vision interface	ISP is not used for this sensor.
OV10640 MIPI REV E (CSI2)	OV10640 CSI2 Leopard imaging (LI) sensor on <b>LI Camera CSI2 Interface</b> (for ISS use-cases only)	It outputs RAW 12 in bayer format and ISP is used to convert to required format.
AR0132	Aptina parallel imaging sensor on <b>Aptina Camera Interface</b> (for ISS use-cases only)	The ISP is used to convert from RAW12 to required format. ISP is not tuned for all lighting conditions for this sensor. ISP runs with the fixed set of configuration for this sensor, which may not be good for all conditions.
AR0140 (Parallel)	Parallel Leopard imaging (LI) sensor <b>Aptina Camera Interface</b> (for ISS use-cases only)	The ISP is used to convert from RAW12 to required format. Algorithms (AEWB) is tuned for this sensor
TIDA00262	Connected to UB960 EVM, this module has AR0140 AT sensor and 913 Serializer. Please refer <b>Error! Reference source not found.</b>	The ISP is used to convert from RAW12 to required format. Algorithms (AEWB) is tuned for this sensor.
IMI (OV10640)	Connected to UB960 EVM, this module has OV10640 sensor and 913 Serializer	The ISP is used to convert from RAW12 to YUV420. Algorithms (AEWB) is tuned for this sensor
OV2775 CSI2	OV2775 CSI2 sensor on CSI2 receiver connector	It outputs RAW 12 in bayer format and ISP is used to convert to required format. Algorithms (AEWB) is not tuned for this sensor.

Table below lists the different features supported by each sensor for the ISS case.

<b>Features\ Sensor</b>	<b>OV1064 0 REV E CSI2</b>	<b>AR0140 Parallel</b>	<b>TIDA 00262</b>	<b>AR0132 Parallel</b>	<b>IMX224 CSI2</b>	<b>IMI OV1064 0</b>	<b>OV2775 CSI2</b>
Linear Mode		✓	✓	✓	✓	✓	✓

## 2.6 Software Installation

PROCESSOR\_SDK\_VISION\_03\_xx\_xx\_xx\_setupwin.exe is the SDK package installer.

Copy the installer to the path of your choice.

Double click the installer to begin the installation.

Follow the self-guided installer for installation.

**IMPORTANT NOTE:** On some computers running as administrator is needed. Right click on the installer and select option of "Run as administrator". If this is not done then you may see a message like "This program might not have installed correctly

On completion of installation a folder by name PROCESSOR\_SDK\_VISION\_03\_xx\_xx\_xx would have been created in the installation path.

### 2.6.1 Uninstall Procedure

To uninstall, double click on uninstall.exe created during installation in the folder PROCESSOR\_SDK\_VISION\_03\_xx\_xx\_xx.

At the end of uninstall, PROCESSOR\_SDK\_VISION\_03\_xx\_xx\_xx folder still remains. It is just an empty folder. It can be deleted manually.

### **3 Build and Run**

This chapter provides a brief overview of the sample application or use case present in the SDK and procedure to build and run it. For more details about optimized build process please refer to VisionSDK\_UserGuide\_BuildSystem.pdf

#### **3.1 Overview of application in release**

The Vision SDK supports the following use-cases are grouped under following categories

- Single Camera Use-cases
- Multi-Camera LVDS Use-cases
- AVB RX Use-cases, (TDA2x & TDA2Ex ONLY)
- Dual Display Use-cases, (TDA2x EVM ONLY)
- ISS Use-cases, (TDA3x ONLY)
- Network RX/TX Use-cases
- Fast boot ISS capture + display (TDA3x ONLY)\*

*\* Not listed in Runtime Menu*

Refer to VisionSDK\_DataSheet.pdf for detailed description of each category.

The demos support devices listed in section 2.4.2 as capture source and HDMI 1080P60 can also be used as a capture source.

The demos support following devices as display devices

- LCD 7-inch 800x480@60fps
- LCD 10-inch 1280x720@60fps
- LCD 10-inch 1920x1200@60fps
- HDMI 1080p60 (default)

Use option "s" on the main menu in UART to select different capture and display devices.

## 3.2 Building the application

- a) On windows command prompt, go inside the directory  
PROCESSOR\_SDK\_VISION\_03\_xx\_xx\_xx\vision\_sdk\build.
- b) Open file Rules.make and  
set **MAKEAPPNAME=apps** and **MAKECONFIG=tda3xx\_evm\_bios\_all**
- c) Build is done by executing gmake. "gmake" is present inside XDC package. For "gmake" to be available in windows command prompt, the XDC path must be set in the windows system path.

**IMPORTANT NOTE:** xdc path is needed to be set in environment variables. If not, then set it using the set PATH =

<Install\_dir>\ti\_components\os\_tools\windows\xdctools\_x\_xx\_xx\_xx;%PATH% in command prompt

**IMPORTANT NOTE:** A15 Compiler and linker MUST be installed before proceeding else compile will fail. Also make sure the compiler is installed at the exact path as mentioned in [Directory Structure](#) .

**IMPORTANT NOTE:** If the installation folder depth is high then windows cmd prompt fails with error that it cannot find a file, even in file is present in mentioned path, this is because Windows has a limitation of 8191 characters for the commands that can execute. In such a situation as a workaround either restrict the folder depth to d:/ or if it cannot be restricted use git bash (version 2.13) to build. Refer <https://support.microsoft.com/en-in/kb/830473> for more details.

(Always point to xdc path gmake only)

- d) Under vision\_sdk\build directory
  - i. When building first time run the below sequence of commands
    - > **gmake -s -j depend**
    - > **gmake -s -j**
  - ii. When building after the first time or incremental build, run the below command
    - > **gmake -s -j**

Executing "**gmake -s -j depend**" will build all the necessary components (PDK drivers, EDMA drivers and sdk dependent files) and "**gmake -s -j**" will build the Vision SDK framework and examples.

**IMPORTANT NOTE:** For incremental build, make sure to do "gmake -s -j depend" before "gmake -s -j" when below variables specified in \vision\_sdk\\$(MAKEAPPNAME)\configs\\$(MAKECONFIG)\\*\_cfg.mk are changed

- when PROC\_\$(CPU)\_INCLUDE is changed
- when DDR\_MEM is changed
- when PROFILE is changed
- when ALG plugin or usecase is enabled or disabled in  
 \vision\_sdk\\$(MAKEAPPNAME)\configs\\$(MAKECONFIG) \\*\_cfg.mk
- when any .h or .c file in TI component is installed in ti\_components is changed
- when any new TI component is installed in ti\_components

If "gmake -s -j depend" is not done in these cases then build and/or execution may fail.

**IMPORTANT NOTE:** When options (other than those specified above) are changed in \vision\_sdk\\$(MAKEAPPNAME)\configs\\$(MAKECONFIG)\cfg.mk, a clean build is recommended for the updated settings to take effect.

- e) On a successful build completion, following executables will be generated in the below path

```
\vision_sdk\binaries\$(MAKEAPPNAME)\$(MAKECONFIG)\vision_sdk\bin\tda3xx-  
evm  
  
vision_sdk_arp32_1_release.xearp32F  
vision_sdk_c66xdsp_1_release.xe66  
vision_sdk_c66xdsp_2_release.xe66  
vision_sdk_ipu1_0_release.xem4  
vision_sdk_ipu1_1_release.xem4
```

- f) To speed up the incremental builds the following can be done as required.

The number of processors included in the build can be changed by modifying below values in \vision\_sdk\\$(MAKEAPPNAME)\configs\\$(MAKECONFIG)\cfg.mk. A value of "no" means CPU not included in build, value of "yes" means CPU included in build. Make sure to do clean build and then "**gmake -s -j depend**" before "**gmake -s -j**" when number of CPUs included is changed

```
PROC_DSP1_INCLUDE=yes  
PROC_DSP2_INCLUDE=yes  
PROC_EVE1_INCLUDE=yes  
PROC_IPU1_0_INCLUDE=yes  
PROC_IPU1_1_INCLUDE=yes
```

- g) The build configuration that is selected in config file can be confirmed by doing below

```
> gmake -s showconfig
```

- h) Cleaning the build can be done by following command

```
> gmake -s clean
```

Alternatively, below folder can be deleted to delete all generated files

```
> rm -rf  
..\binaries\$(MAKEAPPNAME)\$(MAKECONFIG)\vision_sdk\bin  
> rm -rf ..\links_fw\include\configs
```

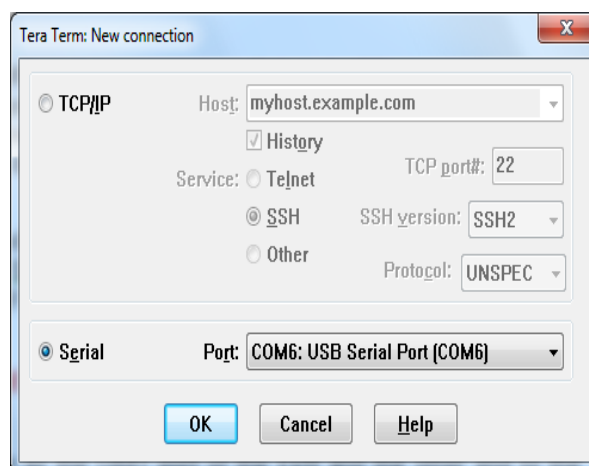

### 3.3 UART settings

Connect a serial cable to the UART port of the EVM and the other end to the serial port of the PC (*configure the HyperTerminal at 115200 baud rate*) to obtain logs and select demo. EVM it detects 4 UART ports, you need to select the 3rd one.

**IMPORTANT NOTE:** On some EVMs we were observing that UART terminal does not work. Updating the USB to UART driver on PC made UART work on the failings PCs. You can download the drivers from the below link.

<http://www.ftdichip.com/Drivers/VCP.htm>

<http://www.ftdichip.com/Drivers/CDM/CDM%20v2.10.00%20WHQL%20Certified.exe>

Tera Term: Serial port setup

Port:	COM6	OK
Baud rate:	115200	
Data:	8 bit	Cancel
Parity:	none	Help
Stop:	1 bit	
Flow control:	none	

Transmit delay

0	msec/char	0	msec/line
---	-----------	---	-----------

## 3.4 Boot Modes

Supported boot modes on TDA3xx ES1.0 and ES2.0 device:

Boot Mode	EVM Switch Setting SYSBOOT(SW2)[1:16]	EVM Switch Setting SW8001[1:8]
QSPI_1	00011000 10000001	0100 0001
QSPI_4	10011000 10000001	0100 0001
NOR	01011000 10000101	1100 0001
Debug	00111000 10000001	XXXXXXXX

## 3.5 Load using QSPI

### 3.5.1 Steps to generate qspi writer tools

NOTE: SBL qspi image is built from pdk package. To build qspi, run the command `gmake -s sbl` from `vision_sdk\build` directory. This generates all required tools and all sbl images under `vision_sdk\binaries\$(MAKEAPPNAME)\$(MAKECONFIG)\sbl` directory.

1. The flash writer is present in  
`vision_sdk\binaries\$(MAKEAPPNAME)\$(MAKECONFIG)\sbl\qspi_flash_writer\$(PLATFORM)\qspi_flash_writer_ipu1_0_release.xem4`
2. The SBL images are present in  
`vision_sdk\binaries\$(MAKEAPPNAME)\$(MAKECONFIG)\sbl\qspi\$(OPP)\$(PLATFORM)\sbl_qspi_$(OPP)_ipu1_0_release.tiimage`

**IMPORTANT NOTE:** “`gmake -s sbl`” requires GCC tools need to be installed in “`<install dir>/ti_components/cg_tools/windows/gcc-arm-none-eabi-4_9-2015q3`” location. Tool can be downloaded from below link.

<https://launchpad.net/gcc-arm-embedded/+milestone/4.9-2015-q3-update>

### 3.5.2 Steps to generate appimage

Following steps need to be followed to generate the application image

1. Make sure the executables are built as shown in [Building the application](#)
2. To generate the application image run below command from “`vision_sdk\build`” folder  
`> gmake -s appimage`

**IMPORTANT NOTE:**

- The config options, like CPUs to use, debug or release profile etc, used to make the application image will be the values specified in `\vision_sdk\$(MAKEAPPNAME)\configs\$(MAKECONFIG)\cfg.mk`
- **The Surround View LUT and Perspective Matrix are flashed at an offset of 20 MB in the QSPI hence make sure the generated appImage doesn't exceed 20 MB in case Surround View use cases are intended to be run.**

### 3.5.3 Flashing steps

Flashing pin settings: Please refer [Boot Modes](#) for pin boot mode pin setting.

SYSBOOT  
Switch

**NOTE:** Image indicates the sysboot position on board not the switch settings

For loading binaries using CCS refer [Load using CCS](#) till step 8.

1. Connect M4 (IPU). Do CPU reset
2. Load below image on M4

**C:\PROCESSOR\_SDK\_VISION\_03\_XX\_XX\_XX\vision\_sdk\binaries\\$(MAKEAPPNAME)\\$(MAKECONFIG)\sbl\qspi\_flash\_writer\\$(PLATFORM)\qspi\_flash\_writer\_ipu1\_0\_release.xem4**

3. Run the core. You would see below console logs

```
[Cortex_M4_IPU1_C0]
QSPI Flash writer application
Enter Device type to use
1 - 1 bit read from flash
2 - 4 bit (Quad) read from flash
Select appropriate Device Type, for TDA3x EVM, press '2'.
MID - 1
DID - 18
Enter 0 for Erase-Only (without flashing any image)
Note : File size should be less than 33554432 Bytes.
Enter the file path to flash:
C:\PROCESSOR_SDK_VISION_03_XX_XX_XX\vision_sdk\binaries\$(MAKEAPPNAME)\$(MAKECONFIG)\sbl\qspi\$(OPP)\$(PLATFORM)\sbl_qspi_$(OPP)_ipu1_0_release.tiimage
Enter the Offset in bytes (HEX) 0x00
```

Erase Options:

- ```
-----
0 -> Erase Only Required Region
1 -> Erase Whole Flash
2 -> Skip Erase
```

**Enter Erase Option: 1**

Load Options:

- ```
-----
0 -> fread using code (RTS Library)
1 -> load raw using CCS (Scripting console)
```

**Enter Load Option: 0**

Read xxxxxx bytes from [100%] file...Done.

QSPI whole chip erase in progress

QSPI file write started

```
*****QSPI flash completed
sucessfully*****
```

4. Reset the board and Repeat step 1, 2, 3.

**NOTE:** If flashing binaries for fast boot use case then the file name and offsets will be different and this step needs to be done twice, once for UCEarly, once for UCLate. Refer section [section 3.10.3](#) for steps to generate binaries, binary names, offsets

<p>[Cortex_M4_IPU1_C0] QSPI Flash writer application Enter Device type to use 1 - 1 bit read from flash 2 - 4 bit (Quad) read from flash <b>Select appropriate Device Type, for TDA3x EVM, press '2'.</b> MID - 1 DID - 18 Enter the File Name <b>c:\PROCESSOR_SDK_VISION_03_XX_XX_XX\vision_sdk\binaries\\$(MAKEAPPNAME)\\$(MAKECONFIG)\vision_sdk\bin\\$(SOC)\sbl_boot\AppImage_UcEarly_BE</b>  Enter the Offset in bytes (HEX): <b>0x80000</b>  Erase Options: ----- 0 -&gt; Erase Only Required Region 1 -&gt; Erase Whole Flash 2 -&gt; Skip Erase Enter Erase Option: <b>0</b></p>	<p>Load Options: ----- 0 -&gt; fread using code (RTS Library) 1 -&gt; load raw using CCS (Scripting console) Enter Load Option: <b>1</b>  Open Scripting console window by clicking "Menu -&gt; View -&gt; Scripting console" and enter below command on scripting console.  <b>loadRaw(0x80500000, 0, "C:/VISION_SDK_XX_XX_XX_XX/vision_sdk/binaries/\$(MAKEAPPNAME)/\$(MAKECONFIG)/vision_sdk/bin/\$(SOC)/sbl_boot/AppImage_UcEarly_BE", 32, false);</b>  <b>IMPORTANT NOTE:</b> The load address in loadRaw command could be different based on the board/SBL size etc. SBL figures out the address and prints it on CCS console. Use this address in loadRaw command for copying AppImage_BE.  In CCS console Enter any alpha-numeric key once loadraw is complete... as shown in below image  QSPI file write started *****QSPI flash completed successfully*****</p>
--	--

<p>[Cortex_M4_IPU1_C0] QSPI Flash writer application Enter Device type to use 1 - 1 bit read from flash 2 - 4 bit (Quad) read from flash <b>Select appropriate Device Type, for TDA3x EVM, press '2'.</b> MID - 1 DID - 18 Enter the File Name <b>c:\PROCESSOR_SDK_VISION_03_XX_XX_XX\vision_sdk\binaries\\$(MAKEAPPNAME)\\$(MAKECONFIG)\vision_sdk\bin\\$(SOC)\sbl_boot\AppImage_UcLate_BE</b>  Enter the Offset in bytes (HEX): <b>0xA80000</b></p>	<p>Load Options: ----- 0 -&gt; fread using code (RTS Library) 1 -&gt; load raw using CCS (Scripting console) Enter Load Option: <b>1</b>  Open Scripting console window by clicking "Menu -&gt; View -&gt; Scripting console" and enter below command on scripting console.  <b>loadRaw(0x80500000, 0, "C:/VISION_SDK_XX_XX_XX_XX/vision_sdk/binaries/\$(MAKEAPPNAME)/\$(MAKECONFIG)/vision_sdk/bin/\$(SOC)/sbl_boot/AppImage_UcLate_BE", 32, false);</b>  <b>IMPORTANT NOTE:</b> The load address in loadRaw command could be different based on the board/SBL size etc. SBL figures out the address and prints it on CCS console. Use this</p>
---	--

<p><i>Erase Options:</i> -----</p> <p>0 -&gt; Erase Only Required Region 1 -&gt; Erase Whole Flash 2 -&gt; Skip Erase Enter Erase Option: <b>0</b></p>	<p><i>address in loadRaw command for copying AppImage_BE.</i></p> <p><i>In CCS console Enter any alpha-numeric key once loadraw is complete... as shown in below image</i></p> <p><i>QSPI file write started</i>  *****QSPI        flash        completed  successfully*****</p>
--	--

- On completion change the pin setting as shown in [Boot Modes](#) table.

### 3.6 Load using QSPI and SD boot

In this mode SBL boots from QSPI but AppImage boots from SD card. This allows us to flash SBL once to QSPI and subsequently we can boot new AppImage just by copying AppImage to SD card.

#### 3.6.1 Steps to generate qspi writer tools

**NOTE:** SBL image for the qspi sd boot is built from pdk package. To build this image, Run the command **gmake -s sbl** from vision\_sdk\build dir. This generates all required tools under vision\_sdk\binaries\\$(MAKEAPPNAME)\\$(MAKECONFIG)\sbl\

1. The flash writer is present in  
vision\_sdk\binaries\\$(MAKEAPPNAME)\\$(MAKECONFIG)\sbl\qspi\_flash\_writer\\$(PLATFORM)\qspi\_flash\_writer\_ipu1\_0\_release.xem4
2. The SBL images are present in  
vision\_sdk\binaries\\$(MAKEAPPNAME)\\$(MAKECONFIG)\sbl\qspi\_sd\\$(OPP)\\$(PLATFORM)\sbl\_qspi\_sd\_\$(OPP)\_ipu1\_0\_release.tiimage

**IMPORTANT NOTE:** "gmake -s sbl" requires GCC tools need to be installed in "<install dir>/ti\_components/cg\_tools/windows/gcc-arm-none-eabi-4\_9-2015q3" location. Tool can be downloaded from below link.

<https://launchpad.net/gcc-arm-embedded/+milestone/4.9-2015-q3-update>

#### 3.6.2 Steps to generate appimage

Following steps need to be followed to generate the application image

1. Make sure the executables are built as shown in [Building the application](#)
2. To generate the application image run below command from "vision\_sdk\build" folder  
> gmake -s appimage

**IMPORTANT NOTE:** The config options, like CPUs to use, debug or release profile etc, used to make the application image will be the values specified in \vision\_sdk\\$(MAKEAPPNAME)\configs\\$(MAKECONFIG)\cfg.mk

#### 3.6.3 Flashing steps

Flashing pin settings: Please refer [Boot Modes](#) for pin boot mode pin setting.

For loading binaries using CCS refer [Load using CCS](#) till step 8.

1. Connect M4 (IPU). Do CPU reset
2. Load image on M4  
(C:\PROCESSOR\_SDK\_VISION\_03\_XX\_XX\_XX\vision\_sdk\binaries\\$(MAKEAPPNAME)\\$(MAKECONFIG)\sbl\qspi\_flash\_writer\\$(PLATFORM)\qspi\_flash\_writer\_ipu1\_0\_release.xem4)
3. Run the core.

You should get below logs on console outputs

<pre>[Cortex_M4_IPU1_C0] QSPI Flash writer application Enter Device type to use 1 - 1 bit read from flash 2 - 4 bit (Quad) read from flash Select appropriate Device Type, for TDA3x EVM, press '2'. MID - 1 DID - 18 Enter 0 for Erase-Only (without flashing any image) Note : File size should be less than 33554432 Bytes.</pre>	<pre>Enter the file path to flash: C:\PROCESSOR_SDK_VISION_03_XX_XX_XX\vision_sdk\binaries\\$(MAKEAPPNAME)\\$(MAKECONFIG)\sbl\qspi_sd\\$(OPP)\\$(PLATFORM)\sbl_qspi_sd_\$(OPP)_ipu1_0_release.tiimage  Enter the Offset in bytes (HEX) 0x00  Erase Options: ----- 0 -&gt; Erase Only Required Region 1 -&gt; Erase Whole Flash 2 -&gt; Skip Erase Enter Erase Option: 1  Load Options: ----- 0 -&gt; fread using code (RTS Library) 1 -&gt; load raw using CCS (Scripting console) Enter Load Option: 0  Read xxxxxx bytes from [100%] file...Done. QSPI whole chip erase in progress QSPI file write started *****QSPI flash completed sucessfully*****</pre>
--	--

**NOTE:** User needs to copy the AppImage to root folder in SD card and insert SD card and power on EVM to boot it. SD card should be formatted as FAT32 with 512 bytes per sector.

### 3.7 Load using CCS

After installing CCS, follow below steps to complete the platform setup,

1. GELs are available in

<Install\_dir>\ti\_components\ccs\_csp \auto\_device\_support\_x.x.x.zip  
NOTE:

- GELs are also available at  
[http://processors.wiki.ti.com/index.php/Device\\_support\\_files](http://processors.wiki.ti.com/index.php/Device_support_files)

Under Automotive pick  
**Automotive vX.X.X**

- To install the new GEL versions, you need to extract the zip to  
<CCS\_INSTALL\_DIR>/ccsv6/ccs\_base

Change the following GEL files for vision SD as below,

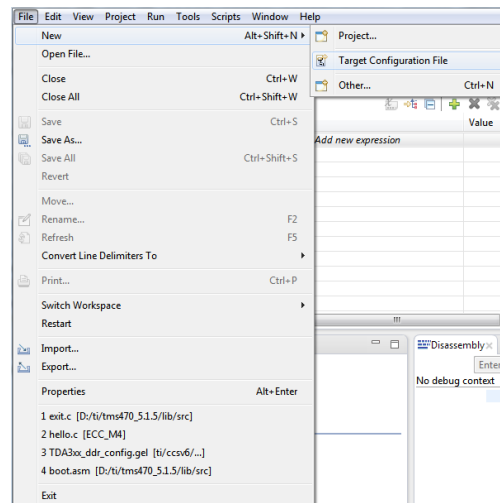

- TDA3xx\_multicore\_reset.gel
  - Set VISION\_SDK\_CONFIG to 1
  - 256MB mode not supported

2. CCS Target Configuration creation:

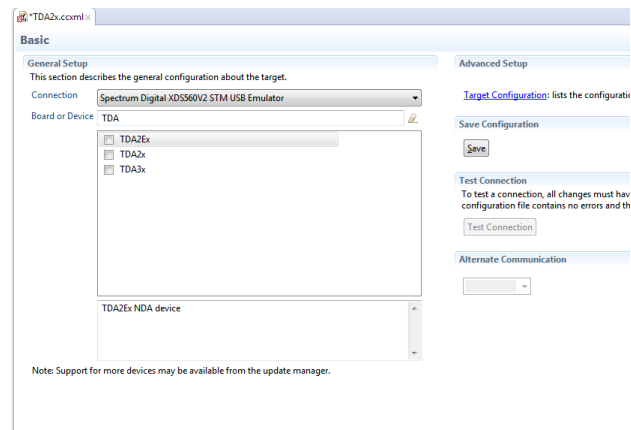

- a. Open "Target Configurations" tab, by navigating through the menu "View ->Target Configurations".

- b. Create a new Target Configuration (TDA3xx Target Configuration) by navigating through the menu "File->New->Target Configuration File".

- c. Specify Connections as "Spectrum Digital XDS560V2 STM USB Emulator". Specify Board or Device as "TDA3x".

3. Connect JTAG to the board.

4. Reset EVM through the power recycle button.

5. Now launch the previously created TDA3xx Target Configuration.

6. Connect to core Cortex\_M4\_IPU1\_C0.

7. On successful connect, the following log appears on CCS console:

*Cortex\_M4\_IPU1\_C0: GEL Output: --->>> TDA3xx Target Connect Sequence DONE !!!!! <<<---*

8. Select Cortex\_M4\_IPU1\_C0, navigate to Scripts->TDA3xx MULTICORE Initialization TDA3xx\_MULTICORE\_EnableALLCores

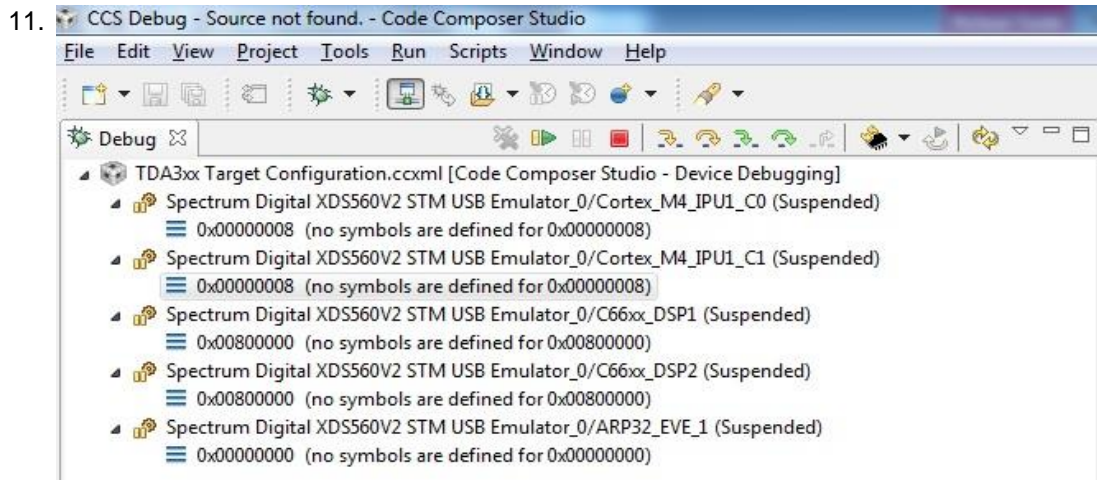

9. On successful script execution, the following log appears on CCS console:

*Cortex\_M4\_IPU1\_C0: GEL Output: --->>> EVESS Initialization is DONE! <<<---*

10. Now connect the core shown below

ARP32\_EVE\_1, C66xx\_DSP1, C66xx\_DSP2 and Cortex\_M4\_IPU1\_C1

12. On the cores load the binaries as mentioned below

On ARP32\_EVE\_1, load the binary, "vision\_sdk\_arp32\_1\_release.xearp32F".

On C66xx\_DSP2, load the binary, "vision\_sdk\_c66xdsp\_2\_release.xe66".

On C66xx\_DSP1, load the binary, "vision\_sdk\_c66xdsp\_1\_release.xe66".

On Cortex\_M4\_IPU1\_C0, load the binary, "vision\_sdk\_ipu1\_0\_release.xem4".

On Cortex\_M4\_IPU1\_C1, load the binary, "vision\_sdk\_ipu1\_1\_release.xem4".

**IMPORTANT NOTE:** Binary for Cortex\_M4\_IPU1\_C0 MUST be loaded before Cortex\_M4\_IPU1\_C1 since IPU1-0 does MMU config for the complete IPU1 system. Other binaries can be loaded in any order.

### 3.8 Run the demo

#### 3.8.1 Single channel demos with HDMI input

**IMPORTANT NOTE:** To demonstrate better output all single channel use cases that require HDMI input should use video clips mentioned in the table below. These clips can be downloaded from

<https://cdds.ext.ti.com/ematrix/common/emxNavigator.jsp?objectId=28670.42872.30602.25095>.

Use case No. "Runtime Menu"	Use case	Input clip to be played by HDMI player
7	1CH VIP capture + Sparse Optical Flow (EVE1) + Display	Clip2
b	b: 1CH VIP capture (HDMI) + Lane Detect (DSP1) + Display	Clip1
c	c: 1CH VIP capture (HDMI) + SOF (EVE1) + SFM (DSP1) + Display	Clip2
d	d: 1CH VIP capture (HDMI) + Traffic Light Recognition (TLR) (DSP1) + Display	Clip2
e	e: 1CH VIP capture (HDMI) + Pedestrian, Traffic Sign, Vehicle Detect 2 (EVE1 + DSP1) + Display	Clip2
f	f: 1CH VIP capture (HDMI) + FrontCam Analytics 2 (PD+TSR+VD+LD+TLR+SFM) (DSPx, EVEx) + Display (HDMI)	Clip3

**SFM\_POSE.bin** - SFM (Usecase 'c') and EUNCAP demo (Usecase 'f') needs SFM\_POSE.bin on the **SD card**. It will be available as part of the file downloaded from the above link.

#### 3.8.2 Steps to run

1. Power-on the Board after loading binaries by (SD, QSPI, NOR or CCS) and follow [Uart settings](#) to setup the console for logs and selecting demo.
2. For HDMI as input select capture source as HDMI "s: System Settings"-> "Capture Settings" -> "2: HDMI Capture 1080P60"
3. Select demo required from the menu by keying in corresponding option from the uart menu.

**IMPORTANT NOTE:** Make sure you select SCV (1Ch VIP capture) use-case or ISS use-case depending on the camera that is connected and supported

After successful initialization of the use-case, you will see video been display on the HDMI as shown below

a. SCV use-cases:

b. EDGE Detect use-case:

c. Sparse optical flow usecase

### 3.9 DCC

Dynamic Camera Configuration (DCC) tool is a PC based tool suit that is primarily used for offline tuning of raw images obtained from raw camera sensors connected to ISS hardware. Apart of tuning tool, DCC also contains ISP simulator.

**NOTE:** DCC tool can be downloaded from the below CDDS link. DCC version 2.1, compatible with the Vision SDK 3.0 release, should be installed. Please contact local TI FAE to get access to this CDDS link.

<https://cdds.ext.ti.com/ematrix/common/emxNavigator.jsp?objectId=28670.42872.33350.26722>

DCC tool is dependent on matlab runtime libraries, refer to the DCC user guide and install required MatLab runtime.

DCC tuning tool with help of plug-ins generate a set of DCC XML and BIN files. BIN files contain tuned values in binary file format for various ISP modules. These binary files for different ISP modules are merged into single binary file and used in the Vision SDK ISS sensor framework.

The binary file can also be flashed in the QSPI. Network tool command `iss_save_dcc_file` can be used to save DCC binary file in the QSPI. Refer to the network tool documentation (VisionSDK\_UserGuide\_NetworkTools.pdf) for more information on this command.

When ISS use case is run in the vision sdk, it reads these binary files, parses them and applies to the ISP modules. Vision SDK first tries to use DCC binary file from the QSPI, if it is not available in the QSPI, it will use binary file from the ISS sensor layer. If the binary file is not available even in ISS sensor layer, it uses ISP default parameters.

**IMPORTANT NOTE:** DCC is currently supported only for AR0140, AR0132, IMX224 and OV10640 Rev E sensors. For AR0140 sensor, the DCC xml files with the tuned ISP parameters can be found in the path `vision_sdk\apps\src\rtos\iss\src\sensor\ar0140\dcc_xml`, for AR0132 sensor, they can be found in the path `vision_sdk\apps\src\rtos\iss\src\sensor\ar0132\dcc_xml`, for OV10640 Rev E driver, they can be found in the path `vision_sdk\apps\src\rtos\iss\src\sensor\ov10640\dcc_xml` and for IMX224 driver, they can be found in the path `vision_sdk\apps\src\rtos\iss\src\sensor\imx224\dcc_xml`

DCC tuning tool exposes key parameters for each plugin which controls important tuning parameters. Users who are imaging and TI ISP experts can control/modify each parameter of plugin through XML files. Use below steps for updating and applying new tuned parameters.

- Update the DCC xml file for the ISP modules for the given sensor
- Convert xml file to binary file using dcc generator tool. This is a windows based tool to convert xml file to binary file. This tool can be found from the `vision_sdk\apps\tools\dcc_tools\dcc_gen_win.exe`. This tool takes name of the xml file as an argument and generates the binary file from xml file at the same folder where xml file is stored.
  - Usage: `dcc_gen_win.exe <Plugin's XML FILE >`
- Send the binary file to the target using `iss_send_dcc_file` command of the network tool. Please refer to the network tool documentation for getting information on network tool

**IMPORTANT NOTE:** DCC xml to bin file convertor, `dcc_gen_win.exe`, is supported only on Windows platform. Also this tool is dependent on DCC GUI tool, so make sure that the gui tool is

installed on the computer before using dcc\_gen\_win.exe executable. Please contact local TI support to get DCC GUI tool.

Once the tuned parameters are tested and finalized, they can be permanently stored in the QSPI or in driver.

For storing tuned parameters in the QSPI, run iss\_save\_dcc\_file command of the network tool. Please refer to the network tool documentation (VisionSDK\_UserGuide\_NetworkTools.pdf) for more information about this command. This command saves the binary file at the fixed offset in the QSPI. After saving the binary file in QSPI, restart the ISS usecase to check the output of the tuned parameters.

For storing tuned parameters in the sensor driver, go to the dcc\_xml folder under sensor driver. For example, for AR0140 sensor, go to the vision\_sdk\apps\src\rtos\iss\src\sensor\ar0140\dcc\_xml\. This folder contains all the xml files that vision sdk is using for this sensor. Copy the updated the xml file under this folder and run generate\_dcc.bat file from the windows. This batch file converts all xml files into binary files, merges all binary files to single binary file and converts binary file to header file, which will be used by the driver. After running this batch, restart the ISS usecase to check the output of the tuned parameters.

Below is list of the DCC plugins supported in vision SDK.

ISIF_CLAMP	DC Offset/Black Level offset in the ISIF This plugin is currently used only for setting blank level offset. No other parameters from this plugin are used.
IPIPE_GIC	Green Imbalance Correction Module of IPIPE
IPIPE_NF1	Noise Filter 1 module of the IPIPE
IPIPE_NF2	Noise Filter 2 module of the IPIPE
IPIPE_DPC_OTF	Defect correction OTF module
IPIPE_CFA	Color Filter Array module
IPIPE_Gamma	Gamma Correction module
IPIPE_RGB2RGB1	RGB to RGB color correction module-1 Supports multi photospace*, which means multiple set of parameters can be defined based on the photospace for this module.
IPIPE_3D_LUT	3D Lut module
IPIPE_RGB2RGB2	RGB to RGB color correction module-2 Supports multi photospace*
IPIPE_RGB2YUV	RGB to YUV Color Conversion module
IPIPE_EE	Edge Enhancer module
IPIPEIF_SPLIT	VP Decompanying module of the IPIPEIF
IPIPEIF_WDRMERGE	WDR Merge and WDR Companding module of the IPIPEIF Most of the WDR merge parameters are calculated on the fly based on the exposure ratio, so the only WDR merge parameter used from this plugin are enable and black level for long and short exposure.
GLBCE	GLBCE module

NSF3V	NSF3v module Supports multi photospace*
CNF	Chroma noise filter module Supports multi photospace*
AWB_ALG	AWB Calibration Parameters TI AWB algorithm requires these calibration parameters. If not provided, it uses default calibration parameters
LDC	Lens Distortion Correction Module

\* Photospace is defined by three parameters, exposure time, analog gain and color temperature. A range of these parameters creates one photospace. Refer the DCC Gui documentation to get more details on how to create photospace

\* Although multiple photospace is supported only for few modules, xml files for almost all modules could have multiple set of parameters based on the multiple photospace. If the module does not support multiple photospace and xml file contains multiple set of parameters, only the first parameter set is used by the parser.

#### *Updating Mesh LDC table in Vision SDK:*

For the new fisheye lens, follow below steps to update the mesh LDC table

- Get the new LDC table for the new Fisheye lens
- Go to the Vision\_sdk\apps\tools\LDC\_mesh\_table\_convert\ directory in the vision SDK
- Run the perl script convert.pl as shown below  
perl convert.pl input\_table.txt imagewidth imageheight downscalefactor  
Here inputtable.txt file contains mesh LDC table for the new lens  
imagewidth and imageheight are size of the input image  
downscalefactor is the down scale factor by which input table is down scaled.
- It will generate the file input\_table.bin file, convert this bin file to header file using bin2c Vision SDK utility, it can be found under vision\_sdk\apps\tools\dcc\_tools\bin2c.exe
- Replace this header file in vision\_sdk\apps\src\rtos\iss\src\sensor\iss\_tables\iss\_tables\_ldc\_lut\_1920x1080.h
- Rebuild vision sdk

### 3.10 Fast boot usecase

This usecase is mainly targeted for rear view camera systems and mainly demonstrates how boot time can be optimized to show sensor capture output on display (preview) first on power on reset and then switch to analytics output shown on display.

As the execution sequence for this usecase is different than all other usecases, it is not enlisted in console RunTime Menu.

It is a fixed configuration demo usecase which works when you press reset button on the TDA3X EVM.

#### 3.10.1 Usecase configuration

It supports following configuration \_Only\_

1CH ISS Capture + ISP + LDC + Obj detect + Display

- Capture - AR0140 Parallel with TDA3x EVM
- Display - 10 inch LCD
- Boot mode - QSPI

#### 3.10.2 Hardware set up

Refer section 0 "Required H/W modification / Configurations" to understand board modification needed for TDA3X with and above mentioned usecase configuration. It is important to have this done before fast boot usecase is tried. H/w mods for following cannot be skipped.

- I2C to run at 400KHz
- Support for AR0140 or OV10640 REV E

**Figure: TDA3x EVM Fast boot h/w setup**

### 3.10.3 Build

Fast boot is special usecase demonstrating how boot time can be optimized for any vision\_sdk usecase; idea here is to have preview display up in minimum possible time and then switch to actual usecase.

- The usecase is not enlisted in runtime menu it can be enabled using following variable in \vision\_sdk\apps\configs\tda3xx\_evm\_bios\_all\cfg.mk. By default it is "no".

```
# Fast boot usecase is currently supported only for tda3x
FAST_BOOT_INCLUDE=yes
...
```

Remove DSP2 and IPU1\_1 from the \vision\_sdk\apps\configs\tda3xx\_evm\_bios\_all\cfg.mk & define WDR\_LDC\_INCLUDE to "yes"

```
PROC_DSP2_INCLUDE=no
PROC_IPU1_1_INCLUDE=no
NDK_PROC_TO_USE=none
WDR_LDC_INCLUDE=yes
```

**Important Note:** These can be defined 'yes' even in fast boot usecase but they are not needed for this usecase and can contribute to boot time hence removed from build config. User may enable these as per their usecases.

**Important Note:** In order to test the DSP and EVE analytics off and on options one must make sure to not include IPU1\_1 in the build and the PROC\_IPU1\_1\_INCLUDE should be 'no'

- "gmake -s showconfig" command can be used prior to build to confirm the build configuration.
- To build use
  - gmake -s -j depend
  - gmake -s -j
- SBL also needs to be built for fast boot usecase
  - Ensure to remove SBL binaries if SBL was built previously
  - Use "gmake -s sbl" to build SBL

### 3.10.4 Generating and Flashing images

- Refer [section 3.5.1](#) to generate sbl
- To generate the application image run below command from "vision\_sdk\build" folder  
> gmake -s appimage

**IMPORTANT NOTE:** The config options, like CPUs to use, debug or release profile, fast boot enable etc, used to make the application image will be the values specified in \vision\_sdk\apps\configs\tda3xx\_evm\_bios\_all\cfg.mk

- This command should generate AppImages at \vision\_sdk\binaries\apps\tda3xx\_evm\_bios\_all\vision\_sdk\bin\tda3xx-evm\sbl\_boot
  - AppImage\_UcEarly\_BE
  - AppImage\_UcLate\_BE
- Refer [section 3.5.3](#) to flash following images at given offsets.

Image	QSPI offset to be flashed in
sbl_qspi	0x0
AppImage_UcEarly_BE	0x80000
AppImage_UcLate_BE	0xA80000

**Important Note:** Ensure images are flashed at given offsets only, order is not mandatory

### 3.10.5 Run

Press Power On Reset button on Tda3x EVM. Make sure QSPI boot is selected as mentioned in section 0

Pass criteria

- Display should flash up with preview in 1 sec approx
- Use case should switch to Object detect algorithm and Pedestrian / Traffic signs detection should start as soon as they are in field of view after boot up.
- You should see boot time printed on the LCD below the CPU performance bar.
- In order to run the analytics ON (option 3) and OFF (option 4) scenario one can choose to select any of the highlighted menu options. The display shows the status of the PD+ TSR Object detection above the CPU Performance bar.

1: Save Captured Frame

2: Save SIMCOP Output Frame

**3: PD and TSR ON**

**4: PD and TSR OFF**

**Important Note:** Ensure IPU1\_1 image is not a part of the application image when trying these two options.

### 3.11 Surround View Fast Boot Use case

The following compile option in `\vision_sdk\$(MAKEAPPNAME)\configs\$(MAKECONFIG)\cfg.mk` should be used to enable fast boot for 3D Surround View:

`SRV_FAST_BOOT_INCLUDE=yes`

This option builds the Application Image involving only ipu1\_0 and DSP\_1 cores.

**Important Note:** Ensure the post-calibration tables are present on the SD Card that is being used to run the usecase. The details of such tables can be found in the relevant SRV UserGuides.

### 3.12 Surround View Use case under 128 MB DDR configuration

The following changes are required to be made before building and running the Surround View use cases (calibration, 2D and 3D) with the 128 MB DDR configuration:

1. Set 'DDR\_MEM=DDR\_MEM\_128M' in the platform 'cfg.mk' file
2. Remove EVE1, IPU1\_1 and DSP2 from the build in the platform 'cfg.mk' file:
  - `PROC_DSP2_INCLUDE=no`

- PROC\_EVE1\_INCLUDE=no
  - PROC\_IPU1\_1\_INCLUDE=no
  - ECC\_FFI\_INCLUDE=no
3. Make the following changes to the memory sections in the '`\vision_sdk\$(MAKEAPPNAME)\build\tda3xx\mem_segment_definition_128mb.xs`' file:
- EVE1\_VECS\_SIZE = 1\*KB;
  - EVE1\_CODE\_SIZE = 128\*KB;
  - EVE1\_DATA\_SIZE = 128\*KB;
  - IPU1\_1\_CODE\_SIZE = 128\*KB;
  - IPU1\_1\_DATA\_SIZE = 128\*KB;
  - IPU1\_0\_CODE\_SIZE = 6\*MB;
  - IPU1\_0\_DATA\_SIZE = 10\*MB;
  - DSP1\_CODE\_SIZE = 1\*MB;
  - DSP1\_DATA\_SIZE = 11\*MB;
  - DSP2\_CODE\_SIZE = 128\*KB;
  - DSP2\_DATA\_SIZE = 128\*KB;
  - SR1\_FRAME\_BUFFER\_SIZE = 94\*MB;
  - SR1\_BUFF\_ECC\_ASIL\_SIZE = 4\*KB;
  - SR1\_BUFF\_ECC\_QM\_SIZE = 4\*KB;
  - SR1\_BUFF\_NON\_ECC\_ASIL\_SIZE = 4\*KB;
4. Increase the size of SR1 heap to 94 MB in the memory map file (.xs).
5. Exclude the use cases which are out of scope for 128 MB build by setting '`UC_<use case name>=no`' in the platform '`uc_cfg.mk`' file as shown below, so that the sizes of the IPU1\_0 and DSP1 code and data fits within the corresponding memory segments defined in the '`\vision_sdk\$(MAKEAPPNAME)\build\tda3xx\mem_segment_definition_128mb.xs`' file.

The below use-cases are validated with 128 MB memory configuration.

```
UC_saveDisFrame=yes
UC_srv_calibration=yes
UC_iss_mult_capture_isp_simcop_sv_tda3xx=yes
UC_iss_mult_capture_isp_dewarp_3dsv_tda3xx=yes
UC_iss_capture_isp_simcop_display=yes
UC_vip_single_cam_view=yes
```

```
UC_vip_single_cam_view_dsswb=yes
UC_vip_single_cam_display_metadata=yes
```

## 4 Revision History

Version	Date	Revision History
1.0	22th August 2014	Initial Version
2.0	14 <sup>th</sup> November 2014	Added QSPI+SD boot, GCC and CCSversion
3.0	31 <sup>st</sup> December 2014	Some minor changes
4.0	3 <sup>rd</sup> March, 2015	Added new section DCC
5.0	28 <sup>th</sup> June 2015	Added fast boot usecase
6.0	16 <sup>th</sup> Oct 2015	Updated for release 2.8
7.0	18 <sup>th</sup> March 2016	Updated for release 2.9
8.0	18 <sup>th</sup> October 2016	Minor changes and updated for 2.11
9.0	8 <sup>th</sup> February 2017	Minor changes and updates for vision sdk 2.12
10.0	15 <sup>th</sup> Apr 2017	Updated for 128M build
11.0	19 <sup>th</sup> June 2017	Updated linux installer
12.0	29 <sup>th</sup> June, 2017	Updated for Processor SDK Vision 3.0 release
